Homework 6a Reflection

Low & High-Fidelity Prototypes

My new page is the cart page.

Lo-Fi Prototype	Hi-Fi prototype in Figma

In the low-fi prototype, I had only the most necessary information and buttons because I want the interface to be simple and straightforward. In the hi-fi prototype, I worked on a design that matches the style of the other pages (home, products, and details). In the homework 5 version, I wanted to make the action button for check out more obvious, so I placed on the top right and made the font really stand out. I also added all the options for quantity and topping selection to increase flexibility and user freedom and allow the user to make quick changes on the cart page. The button with "delete" is replaced by a "X" because the button looks too long with the word delete and X is simple and communicates the same functionality. A total cost is added on the top and bottom of the page to allow the users to access this information quickly whether they are near the top or the bottom. This would be useful especially when there are many more items in the cart. In the webpage on GitHub, I added a checkout button below total cost for the same reason. I also added a count of items in the cart in the cart button and replaced the "Your shopping cart" with "You added 2 item(s):" as latter is more useful and provides a quick summary of cart status.
